MYKHATA

Project Documentation & Reflection

1. Project Overview

MyKhata is a JavaScript-based expense management application designed to help users manage their daily income and expenses in an easy and organized way. The main objective of this project is to make financial tracking simple and useful for everyone. Users can add their income and expenses, check their available balance, and keep track of their daily spending. This project provides a simple way to understand and manage personal finances without using complicated tools.

2. Features Implemented

The main features implemented in MyKhata are:

- Add Income and Expenses: Users can enter their income and daily expenses.
- Delete Transactions: Users can remove transactions whenever required.
- Balance Calculation: Automatically calculates total income, expenses, and remaining balance.
- Transaction History: Displays previously added income and expense records.
- Interactive Dashboard: Shows important financial information in one place.
- User-Friendly Design: Provides a clean, simple, and responsive interface that is easy to understand and use.

3. Technologies Used

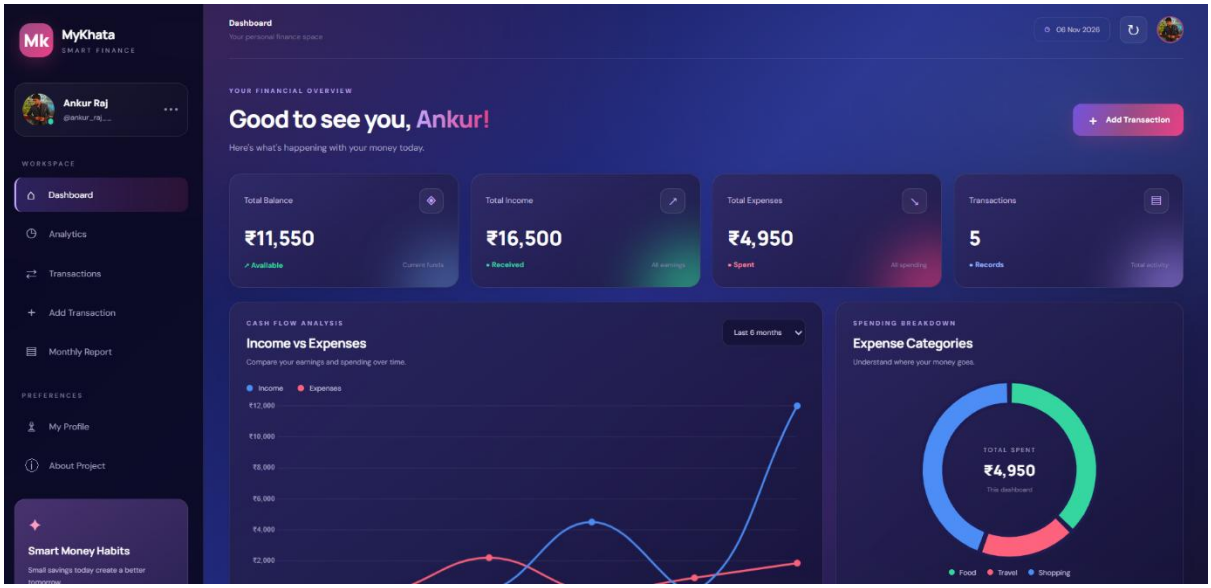

The following technologies were used to develop this project:

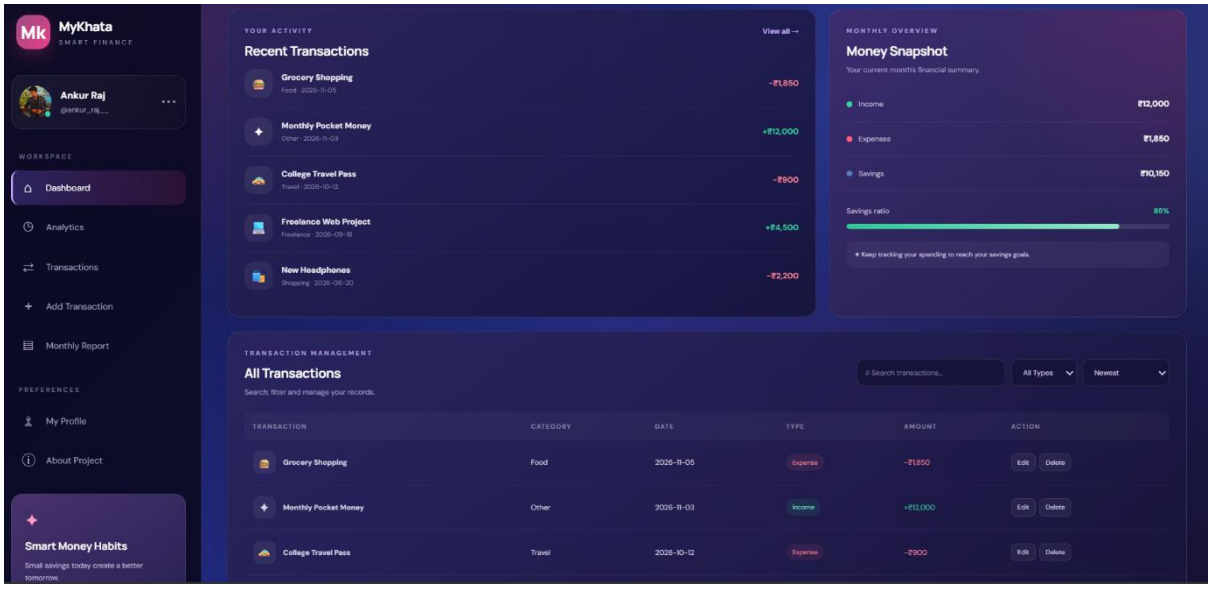

- HTML: Used to create the basic structure and different sections of the website.
- CSS: Used for styling, colors, layouts, spacing, and responsive design.
- JavaScript: Used to add functionality and make the website interactive.

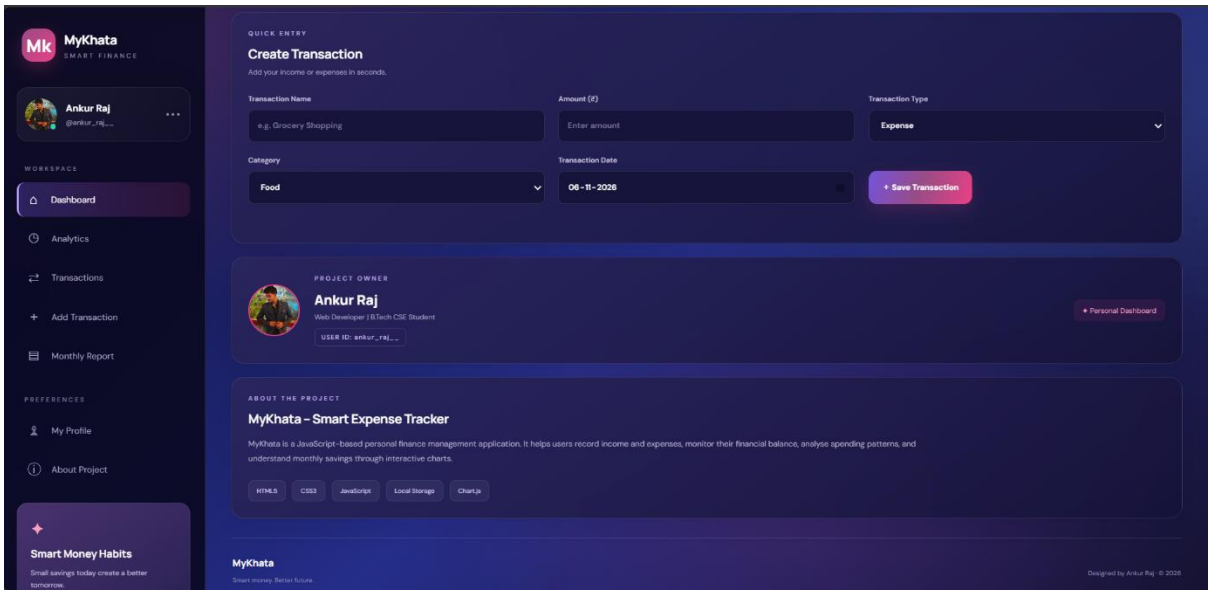

4. JavaScript Concepts Used

While developing this project, I used several important JavaScript concepts such as variables, functions, arrays, objects, conditional statements, loops, DOM manipulation, and event handling. These concepts helped me manage transaction data, perform calculations, handle user actions, and update webpage content dynamically. I also understood how JavaScript connects with HTML elements to make a website interactive.

5. Project Demonstration

6.Challenges Faced

During the development of this project, I faced some challenges in designing the dashboard and managing income and expenses properly. Making all the JavaScript features work correctly was also a little difficult. I also faced some problems with responsive design and DOM manipulation. Sometimes, small coding errors affected the working of different features, so I had to check and test the code several times.

7. Solutions Implemented

To solve these problems, I checked my code carefully and made changes wherever required. I used CSS Flexbox and Grid to improve the layout and make the website responsive. I created separate JavaScript functions for different operations and used event listeners to handle user interactions. I also used DOM manipulation to update the webpage whenever a user added or deleted a transaction.

8. What You Learned

Through this project, I improved my practical knowledge of HTML, CSS, and JavaScript. I learned how to create a complete website from scratch and connect its design with JavaScript functionality. I also understood how to work with arrays and objects, handle user events, perform calculations, and manipulate webpage elements. Most importantly, I learned how to find errors, solve problems, and improve my coding skills through practical development.

9. Future Improvements

In the future, I would like to add more advanced features to MyKhata to make it more useful. These may include user login and registration, monthly and yearly expense reports, charts and graphs for better financial analysis, dark mode, and cloud database integration. I would also like to improve the overall design and add more options to make the application easier and more comfortable to use.
